

Marine Radio Survey

18th Nov 2019

RSI has completed a marine radio survey of a major oil field in the Middle East. All measurements were taken from an engineering supply vessel which followed a route around 104 existing and planned platform locations taking 6 days to complete. TETRA, GSM (3 networks), Marine VHF and Aviation VHF signal levels were measured simultaneously during the survey.

Results were analysed to show areas where coverage was poor and additional fill-in base sites were needed particularly for indoor coverage on the platforms.

RSI – Company Background

Radio Systems Information Ltd. (RSI) is a UK based independent telecommunications consultancy with particular expertise in radio network coverage planning, design, verification, testing and measurement and specialised product development. RSI started trading in 1992 with most clients being large radio communication users and operators such as government, public utilities, emergency services, transport and energy. RSI has developed the Aries TETRA and Aries LTE survey tools for network performance measurement in the critical communications market.
